

Procter & Gamble

June 20, 2003

Procter & Gamble's primary method for transporting EDI data with its trading partners is via the Public Internet utilizing Cyclone Interchange software. (The EDIINT standard which we use is the AS2 standard for secure Internet transactions using the http protocol.)

It is important to note that all current VAN (Value Added Network) customers that wish to remain on a VAN can do so without any changes to their current configurations. P&G will retain a VAN connection with our Global VANs, GXS or Sterling. However, if your company has a strategy for communicating direct point-to-point over the public internet and has a product that is interoperable with P&G's Cyclone Interchange Server, (a product that has been certified as compliant with the EDIINT-AS2 standard to exchange EDI documents over the Internet). Please contact the NA EDI COE at 1-800-DIAL-PNG, extension 41111, option 4

The Uniform Code Council (UCC) has sponsored interoperability tests of EDIINT-AS2 compliant software and plans to sponsor additional tests in the future. At the current time, these companies and products have passed the interoperability tests.

See <http://www.uc-council.org> for an up to date list of companies and products that are interoperable.

Company	Product, Version
bTrade, Inc.	TDAccess/TDPeer/TDNgine/TDBrowser using EDIINT engine, vs. 3.0
